

1. Layout & The Grid System (The Absolute Most Important)

Bootstrap splits every row into **12 invisible columns**. You decide how many columns an element should take up.

- `.container` / `.container-fluid`: The outermost wrapper. Keeps content centered with padding, or stretches full-width (`-fluid`).
- `.row`: A horizontal wrapper that holds columns. **Must** be placed inside a container.
- `.col`: Automatically divides space equally among all columns in a row.
- `.col-1` to `.col-12`: Specifies exactly how wide an element is out of 12 (e.g., `.col-6` takes up exactly half the screen).
- `.col-md-6`: **Responsive column**. Means "take up 6 columns on medium screens (laptops) and above, but stack full-width (12 columns) on mobile phones."

2. Spacing Utilities (Margins & Padding)

Instead of writing custom CSS for spacing, use the property + side + size shorthand:

- **Properties:** `m` (margin) or `p` (padding).
- **Sides:** `t` (top), `b` (bottom), `s` (start/left), `e` (end/right), `x` (left & right), `y` (top & bottom).
- **Sizes:** 0 (none) to 5 (largest).

Examples to remember:

- `.mt-4`: Margin-top (medium gap).
- `.mb-5`: Margin-bottom (large gap).
- `.py-3`: Padding on both Top and Bottom.
- `.mx-auto`: Horizontal margin auto (centers a block element perfectly).

3. Typography & Colors (The Theme)

Change sizes and colors instantly by adding text/background classes.

- `.display-1` to `.display-4`: For massive, beautiful hero text headings.
- `.fs-1` to `.fs-6`: Font-size utility (matches standard `<h1>` through `<h6>` sizes).
- `.fw-bold`: Makes text bold.
- `.text-center` / `.text-end`: Aligns text.
- **The Color Palette:** (Applies to `text-`, `bg-`, or `btn-`)
 - `.text-primary` / `.bg-primary`: Brand Blue

- `.text-success` / `.bg-success`: Success Green
- `.text-danger` / `.bg-danger`: Alert Red
- `.text-dark` / `.text-light`: Dark gray or off-white

4. Flexbox Alignment (Centering Things)

When you need to align items side-by-side or center something perfectly inside a box, use Flexbox utilities on the parent div.

- `.d-flex`: Turns the container into a flexbox layout.
- `.justify-content-center`: Centers items horizontally.
- `.justify-content-between`: Pushes items to opposite edges (great for a logo on the left, menu on the right).
- `.align-items-center`: Centers items vertically.

5. Instant Components (Copy-and-Paste Ready)

Don't style buttons or navigation bars from scratch. Use these base classes:

- **Buttons:** `.btn .btn-primary` (Blue button), `.btn .btn-outline-danger` (Outlined red button).
- **Cards (Containers for content):** `.card`, `.card-body`, `.card-title`, `.card-text`.
- **Images:** `.img-fluid` (Makes any image automatically shrink and scale nicely to fit its column without breaking the page).

How to use this list right now:

When you want to build a section (like a feature block):

1. Create a `.container`.
2. Drop a `.row` inside it.
3. Add two columns: `<div class="col-md-6 mb-3">`.
4. Put a `.card` inside each column.
